

Staying safe while protecting others

First Responder Beware[®]

Natural Gas Safety for First Responders

To report emergencies, call 911 and Rhode Island Energy immediately.

Natural gas emergencies: 1-800-640-1595 Always **call 911** if you suspect a gas leak! Smell Gas. Act Fast. Call 911.

Click on each slide to advance.

Natural gas safety for first responders

- Firefighters, police and EMTs are typically first on the scene in an emergency and face the greatest risk from natural gas leaks and fires.
- Understanding the potential dangers and dealing with them correctly makes everyone safer.
- This program is designed to supplement, not replace, your department's standard operating procedures (SOPs).

Natural gas safety basics

- Properties of natural gas
- The natural gas delivery system
- Preventing natural gas ignition
- Responding to natural gas emergencies

- Indoor natural gas leaks
- Carbon monoxide poisoning
- Outdoor natural gas leaks
- Natural gas fires

Properties of natural gas

Natural gas is lighter than air.

- It will follow the path of least resistance and will travel upward through any available space.
- When underground or in enclosed spaces, natural gas will move laterally or migrate.

Natural gas is odorless. The addition of mercaptan produces the familiar sulfur-like smell.

 You may not always be able to smell mercaptan, so never rely on your nose alone to detect a gas leak. Monitor the atmosphere with your department's approved and calibrated air-monitoring equipment.

Properties of natural gas

- Natural gas is highly flammable.
- Natural gas will burn when the gas-to-air ratio is between about 5% and 15%.
 - At concentrations below 5% or above 15%, natural gas will not burn.
- Liquefied gases, such as propane, have different properties than natural gas.

The natural gas delivery system

- Natural gas travels through three types of pipelines on its way from the wellhead to individual service laterals:
 - Gathering pipelines
 - Transmission lines
 - Distribution mains
- Service laterals carry natural gas from distribution mains to customers' gas meters.
- In general, the closer natural gas gets to the end user, the smaller the pipeline and the lower the pressure.

Single-unit residential meter

Transmission pipeline markers

- **High-visibility markers** indicate the approximate location of transmission pipelines in rights-of-way.
- These markers include the pipeline company's name, the type of product carried and an emergency phone number.
- You can also find the general location of gas transmission pipelines in your area on the National Pipeline Mapping System (NPMS) website at https://www.npms.phmsa.dot.gov.

Rhode Island Energy pipeline marker.

Preventing natural gas ignition

- Even the smallest flame or spark can ignite leaking natural gas. Avoid turning electrical equipment or devices on or off in the vicinity of a leak.
- **DO NOT use spark-producing equipment.** Intrinsically safe radios and flashlights should be used for the duration of any incident response.
- Avoid using doorbells, wall switches, garage door openers or cell phones, and prevent their use by others.
- **DO NOT step on doormats.** Friction from your boots could create a spark of static electricity.

Responding to natural gas emergencies

Notify Rhode Island Energy through your dispatcher as soon as practicable for all gas emergencies, and take these precautions:

- Approach cautiously and stay upwind.
- Park safely away from collapse zones and manholes.
- Secure the perimeter.
- Evacuate **330 feet** in all directions.
- Stay out of manholes and sewers.
- Eliminate ignition sources.
- Use full SCBA and PPE.
- Monitor the atmosphere.

Responding to natural gas emergencies

- *NEVER* attempt to open or close underground pipeline valves.
- First responders who have been trained to do so may turn off gas at aboveground meter valves or appliance supply lines.
 - A quarter turn to the right will turn off a meter. Use the same procedure at an appliance supply line.
 - Inform Rhode Island Energy of any valve you have closed and its precise location.
- After the service valve has been closed, *DO NOT* open it under any circumstances.

Single-unit residential meter

Indoor gas leak response

Natural gas leaks inside buildings present a significant hazard. Take these precautions:

- Have a charged hand line with fog nozzle ready.
- DO NOT use spark-producing equipment.
- Evacuate at least 330 feet in all directions.

Coordinate with Rhode Island Energy before ventilating.

- **Remove all ignition sources.** Ventilate structures from the top down.
- Use extreme caution when ventilating a building with a gas concentration above 15%. As gas disperses, concentrations will pass through the flammable range.

Carbon monoxide

Understanding carbon monoxide (CO) leaks

- CO is a colorless, odorless, poisonous gas.
- **CO leaks are frequently caused when** fuel-burning appliances malfunction or are used without adequate ventilation.

CO poisoning can look like a common illness but is deadly if untreated. Know the signs:

- Flu-like symptoms
- Nausea/confusion/slow breathing
- Loss of consciousness

Make sure victims get fresh air and seek medical attention immediately.

Outdoor gas leaks

- Outdoor natural gas leaks can be caused by construction-related damage, cracks due to extreme weather or pipe corrosion.
- Contact Rhode Island Energy immediately to shut off the gas.
- Evacuate the area.
- Be alert for migrating gas. Gas can accumulate in storm drains, construction trenches, buildings and other utility lines.

Outdoor gas leak indicators

In addition to the familiar sulfur-like smell, other indicators of an outdoor leak include:

- A hissing, whistling or roaring sound
- Dirt blowing into the air from a hole in the ground
- Continuous bubbling in water
- Dead or dying vegetation (in an otherwise moist area) over or near a pipeline
- A damaged connection to a gas appliance
- An exposed pipeline after a disaster

Natural gas pipelines may be orange, black or yellow.

Outdoor gas leak response

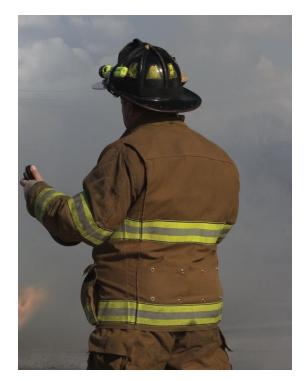

- Evacuate at least 330 feet in all directions.
 Large leaks may require downwind evacuation for at least a half-mile.
- Have a charged hand line with fog nozzle ready for use.
 - In the event of a fire, a fog spray may be used to cool combustible exposures, assist with rescue and extinguish flames not originating from a gas pipe.
- Use a CGI to identify the general area of the leak.
 - Check for gas migrating into nearby buildings (especially basements), storm drains and construction trenches.

Natural gas fire response

- When responding to a fire involving natural gas, your best and safest course of action is to let it burn.
 - Burning natural gas will not cause an explosion.
- Allow the gas to burn until the source can be turned off. When the gas supply is depleted, the fire will extinguish itself.
- Evacuate the area and protect exposures.

Natural gas fire response

• DO NOT use water to suppress a natural gas fire.

- Use a hand line with fog nozzle to cool exposures and to extinguish open flames not originating from a gas pipe.
- Avoid spraying water at the point where natural gas is being released.
- Shut off gas ONLY at the service valve before the meter or the appliance supply line.
- Once gas is off, **remain alert for gas migration and possible re-ignition**.

Natural gas safety review

- **Prevent ignition** of natural gas. Eliminate spark hazards at the scene of a gas leak, and use intrinsically safe equipment.
- When natural gas is involved in an emergency, **notify Rhode Island Energy through your dispatcher as soon as practicable.**
- Park emergency vehicles upwind and away from collapse zones and manholes.
- Evacuate the area and be alert for migrating or accumulating gas.
- **Coordinate with Rhode Island Energy before ventilating.** Remove all ignition sources, and ventilate from the top down.
- NEVER attempt to open or close underground pipeline valves.
- When natural gas is burning, **let it burn and protect area exposures.** Remember, water is not effective for extinguishing gas fires.

Thank you for your attention.
